The 24 periods are the solar terms of the traditional East Asian calendar, the first of which begins at the halfway point between the winter solstice and the vernal equinox. The times for sunrise and sunset (☀) are on the indicated start date, in the corresponding time zone but not adjusted for summer time.

First, roll for precipitation (✱) to determine whether to use the left set of columns for no precipitation (∅) or the right (✱).

Second, roll a number (x) or dice of the given denomination (y) for the interval (☛→☛) keeping the lowest die to determine the number of days the weather will remain with precipitation or not. For marked conditions ($x \geq 16$), the result is 16 days x of 20 times (1d20), else 1d16.

Third, roll 1d6 (▣), to determine the range, potentially using 6d6 in the case of unlikely deviation. A result of 0.5σ indicates a value within 0.5 standard deviation of the mean (\bar{x}), while 1σ is between 0.5 and 1.0, with it being less or greater than the mean indicating colder or hotter, for the daily low (⇓) and high (⇑) temperatures, within the listed minimum (⇓) and maximum (⇑) values ($^{\circ}\text{C}$). The underlined values on either side of the mean (\bar{x}) indicate that the most frequent value (mode) is lower or higher than the mean by at least $\frac{1}{2}$ standard deviation (σ).

Fourth, for no precipitation (∅), roll a number (a) of d20 to determine the the cloud coverage (☁☁☁), and multiply this value by 5%. (Each value on the die indicates a range of $\pm 5\%$, centred on $5n - 2.5\%$).

Fifth, for wind speed (↗), roll a number (a) of the indicated denomination (x), adding together only the lowest two for the value in ‰. (Ideally, this should be considered in the event of precipitation.) The simplified wind roses show the relative frequency of the orientation of wind over 1 ‰, irrespective of speed thereabove, for both precipitation (✱) and none (∅).

Where applicable, the fog column (☁☁☁) shows the percentage of days with at least one hour during which the visibility was less than 1 km and the temperature was within 2.5°C of the dew point with greater than 95 percent relative humidity and less than 4 ‰ wind, as the data do not contain observations for fog.

Sixth, for amount of precipitation (mm per day), roll two dice of the first denomination (x) and keep the lowest; upon rolling the maximum die value, add this one die of the second denomination (y).

Seventh, for the duration of precipitation in hours, roll a number (a) of dice of the first denomination (x) and keep the lowest and add the highest of a number (b) dice of the second denomination (y), limiting the result to the range 1 to 24, except for the cases thusly marked and elaborated below the table.

Source: open.meteo.com, daily 1968–2019 & hourly (for fog only) 2022–2024.

adb	a dice of denomination b
$b \downarrow a \text{ dx}$	lowest a of b dice x
$b \uparrow a \text{ dx}$	highest c of a of b dice x
$b \uparrow a \text{ dx}$	a^{th} highest of b dice x
$a \cdot \text{dx}$	median of a dice x
$x \downarrow y$	lower of x or y
$x \geq y$	if x , then y
$x \geq y : z$	if x , then y , else z
$x \neq y$	if not x , then y
